

Social network Graph Link Prediction - Facebook Challenge

Problem statement:

Given a directed social graph, have to predict missing links to recommend users (Link Prediction in graph)

Data Overview

Taken data from facebook's recruiting challenge on kaggle

<https://www.kaggle.com/c/FacebookRecruiting> (<https://www.kaggle.com/c/FacebookRecruiting>)

data contains two columns source and destination eac edge in graph

- Data columns (total 2 columns):
- source_node int64
- destination_node int64

Mapping the problem into supervised learning problem:

- Generated training samples of good and bad links from given directed graph and for each link got some features like no of followers, is he followed back, page rank, katz score, adar index,

some svd fetures of adj matrix, some weight features etc. and trained ml model based on these features to predict link.

- Some reference papers and videos :
 - <https://www.cs.cornell.edu/home/kleinber/link-pred.pdf>
(<https://www.cs.cornell.edu/home/kleinber/link-pred.pdf>)
 - <https://www3.nd.edu/~dial/publications/lichtenwalter2010new.pdf>
(<https://www3.nd.edu/~dial/publications/lichtenwalter2010new.pdf>)
 - https://kaggle2.blob.core.windows.net/forum-message-attachments/2594/supervised_link_prediction.pdf
(https://kaggle2.blob.core.windows.net/forum-message-attachments/2594/supervised_link_prediction.pdf)
 - <https://www.youtube.com/watch?v=2M77Hgy17cg> (<https://www.youtube.com/watch?v=2M77Hgy17cg>)
(<http://savefrom.net/?url=https%3A%2F%2Fwww.youtube.com%2Fwatch%3Fv%3D2M77Hgy17cg>) chrome&utm_medium=extensions&utm_campaign=link_modifier)

Business objectives and constraints:

- No low-latency requirement.
- Probability of prediction is useful to recommend ighest probability links

Performance metric for supervised learning:

- Both precision and recall is important so F1 score is good choice
- Confusion matrix

3. Ranking Measures

https://networkx.github.io/documentation/networkx-1.10/reference/generated/networkx.algorithms.link_analysis.pagerank_alg.pagerank.html
https://networkx.github.io/documentation/networkx-1.10/reference/generated/networkx.algorithms.link_analysis.pagerank_alg.pagerank.html

PageRank computes a ranking of the nodes in the graph G based on the structure of the incoming links.

Mathematical PageRanks for a simple network, expressed as percentages. (Google uses a logarithmic scale.) Page C has a higher PageRank than Page E, even though there are fewer links to C; the one link to C comes from an important page and hence is of high value. If web surfers who start on a random page have an 85% likelihood of choosing a random link from the page they are currently visiting, and a 15% likelihood of jumping to a page chosen at random from the entire web, they will reach Page E 8.1% of the time. **(The 15% likelihood of jumping to an arbitrary page corresponds to a damping factor of 85%.) Without damping, all web surfers would eventually end up on Pages A, B, or C, and all other pages would have PageRank zero. In the presence of damping, Page A effectively links to all pages in the web, even though it has no outgoing links of its own.**

3.1 Page Ranking

<https://en.wikipedia.org/wiki/PageRank> (<https://en.wikipedia.org/wiki/PageRank>)

```
In [0]: if not os.path.isfile('data/fea_sample/page_rank.p'):
        pr = nx.pagerank(train_graph, alpha=0.85)
        pickle.dump(pr, open('data/fea_sample/page_rank.p', 'wb'))
    else:
        pr = pickle.load(open('data/fea_sample/page_rank.p', 'rb'))
```

```
In [0]: print('min', pr[min(pr, key=pr.get)])
        print('max', pr[max(pr, key=pr.get)])
        print('mean', float(sum(pr.values())) / len(pr))
```

```
min 1.6556497245737814e-07
max 2.7098251341935827e-05
mean 5.615699699389075e-07
```

```
In [0]: #for imputing to nodes which are not there in Train data
        mean_pr = float(sum(pr.values())) / len(pr)
        print(mean_pr)
```

```
5.615699699389075e-07
```

4. Other Graph Features

4.1 Shortest path:

Getting Shortest path between two nodes, if nodes have direct path i.e directly connected then we are removing that edge and calculating path.

```
In [0]: #if has direct edge then deleting that edge and calculating shortest path
        def compute_shortest_path_length(a,b):
            p=-1
            try:
                if train_graph.has_edge(a,b):
                    train_graph.remove_edge(a,b)
                    p= nx.shortest_path_length(train_graph,source=a,target=b)
                    train_graph.add_edge(a,b)
            else:
                p= nx.shortest_path_length(train_graph,source=a,target=b)
            return p
        except:
            return -1
```

```

```

4.5 Katz Centrality:

https://en.wikipedia.org/wiki/Katz_centrality (https://en.wikipedia.org/wiki/Katz_centrality)

<https://www.geeksforgeeks.org/katz-centrality-centrality-measure/>

(<https://www.geeksforgeeks.org/katz-centrality-centrality-measure/>) Katz centrality computes the centrality for a node based on the centrality of its neighbors. It is a generalization of the eigenvector centrality. The Katz centrality for node i is

$$x_i = \alpha \sum_j A_{ij} x_j + \beta,$$

where A is the adjacency matrix of the graph G with eigenvalues

$$\lambda$$

The parameter

$$\beta$$

controls the initial centrality and

$$\alpha < \frac{1}{\lambda_{\max}}.$$

```
In [0]: if not os.path.isfile('data/fea_sample/katz.p'):
        katz = nx.katz.katz_centrality(train_graph,alpha=0.005,beta=1)
        pickle.dump(katz,open('data/fea_sample/katz.p','wb'))
    else:
        katz = pickle.load(open('data/fea_sample/katz.p','rb'))
```

```
In [0]: print('min',katz[min(katz, key=katz.get)])
        print('max',katz[max(katz, key=katz.get)])
        print('mean',float(sum(katz.values())) / len(katz))
```

```
min 0.0007313532484065916
max 0.003394554981699122

In [0]:

Step by Step Guid:

Step_1: As we have used Colab for this case study, we mounted the the Drive first. After that we performed exploratory data analysis on our given data set such as number of followers and followees of each person.

Step_2: Then after we generated some datapoints which were not present in our given data-set, since we had only class label 1 data.

Step_3: Then we did some feature engineering on dataset like

finding shortest path,

kartz centrality,

jaccard distances,

page rank,

preferential attachements

dot SVD etc.

Step_4: After performing eploratory data analysis and feature engineering we splitted whole dataset into train and test and performed random forest and xgboost taking f1-score as our metric.

Step_5: At the end we plotted confusion matrix and pretty-table for both algorithm and found best hyperparameters.
